Running an application:

1. Switch to the z/OS Projects perspective.

2. Define a launch configuration that includes specific environment variables or input parameters for the executable file.

    a) On the workbench toolbar, click the **Run** icon and select **Run**.

    b) In the configurations list, click **Compiled Application**, then click the **New launch configuration** icon.

    c) In the Name field, type a name for the launch configuration. This name is added to a list of options under a **Run With Configuration** menu. Choose a name that you can associate with the program, input parameters, and environment variable values that are defined in the launch configuration

       ✓ On the **Main** tab, define the **Project , Program name** and **Program parameters** in the respective fields.

       ✓ On the **System Environment** tab, specify values for environment variables that the executable file queries at run time.

       ✓ On the **Common** tab, define the type of launch configuration and the perspective you want to use for each launch mode.

3. Click **Apply** and **Close**.

4. Run the program.

. In the Projects view, find the executable file that you want to run.

a. Right-click the executable file and select **Run With Configuration > (launch configuration name you defined previously).**
